

Features:

- Investigation of the operating behavior of centrifugal, piston, and side-channel pumps¹
- All pumps driven separately by three-phase AC motors¹
- Centrifugal pumps can be operated in series or parallel

The experiments familiarize students with various pump types, such as centrifugal and positive displacement pumps.

Tesca Pumps Comparison Apparatus includes two centrifugal pumps, one piston pump as a positive-displacement pump, and a self-priming side-channel pump. The side-channel pump works primarily as a centrifugal pump and, depending on the liquid level, can also act as a positive displacement pump. This means, as a special feature, the side-channel pump also permits gases to be pumped.

The pump being investigated pumps water in a closed circuit. In the process, the performance data of the pump and pressure losses in the pipeline are recorded. The centrifugal pumps can also be operated in parallel or in series. Each pump is driven by a separate

three-phase AC motor. The speed of the motors for the centrifugal pumps is variably adjustable by a frequency converter. All motors are mounted on swivel bearings, so the torque can be measured by way of a force sensor, enabling the mechanical drive power output to be determined.

One free position is likewise equipped with a reversible three-phase AC motor with variable speed.

This position can be used for mounting any pump.

Experiments demonstrate the basic operating behavior of various pump types.

Relevant measured values can be read on digital displays. At the same time, the measured values can also be transmitted directly to a PC via USB. The data acquisition software is included. The performance data of the pump and losses in the pipeline are calculated by the software and represented by characteristic curves. The operating point of the pump can be determined from these characteristics.

The well-structured instructional material sets out the fundamentals and provides a step-by-step guide through the experiments.

Specifications:

- Experiments relating to key issues in pump engineering
- Comparison of various pump types: centrifugal pump, piston pump, side-channel pump
- Operation of centrifugal pumps in parallel or series
- Free position for additional pump
- Three-phase AC motors for centrifugal pumps and additional

Note: Specifications are subject to change.

motor with variable speed by frequency converter

- Optional software for data acquisition via USB under Windows Vista or Windows 7

Technical Specifications:

Centrifugal pump 2x

- Max. flow rate (Q): 300L/min
- Max. head (H): 16,9m
- Nominal speed: 2900min⁻¹

Three-phase AC motor 2x, for centrifugal pump

- Power output: 750W
- Speed range: 750...3000min⁻¹

Side-channel pump, self-priming, one-stage

- Q: 83,3L/min, H: 50m
- Nominal speed: 1450min⁻¹

Three-phase AC motor for side-channel pump

- Power output: 1,1kW
- Speed: 1500min⁻¹

Piston pump

- Q: 17L/min, H: 60m
- Nominal speed: 405min⁻¹

Three-phase AC motor for piston pump

- Power output: 0,55kW
- Speed: 1500min⁻¹

Three-phase AC motor, additional motor, reversible

- Power output: 0,75kW
- Speed range: 750...3000min⁻¹

Measuring ranges

- Flow rate: 0...500L/min
- Intake pressure: -1...1,5bar
- Delivery pressure: 0...10bar
- Torque: 0...15Nm
- Speed: 0...3000min⁻¹
- Pump electrical power consumption: 0...2000W

Experiments:

1. Investigation and comparison of the operating behavior of various pump types:
 - > Centrifugal pumps
 - > Piston pump (positive-displacement pump)
 - > Side-channel pump
2. Plotting a pump characteristic curve
3. Plotting a system characteristic curve
4. Determining efficiency
5. Investigation and comparison of parallel and series configuration of centrifugal pumps - comparison of pump types

Requirements:

400V, 50/60Hz, 3 phases or 230V, 60Hz, 3 phases

Note: Specifications are subject to change.
